

EEG-Gated Racine Grader: EEG and video decide seizure vs non-seizure; video alone grades severity

The EEG network is interchangeable inside the gate (GRU, TCN and a small CPU-trained TCN agree within 0.002 macro-F1). The gain comes from EEG's independent seizure evidence (EEG and video detection errors overlap on 14 clips against 2.4 expected by chance) and from calibrating the two probabilities.
